Scopus AI: Faculty Guide for AI-Integrated Research

Pedagogical Overview: Scopus AI utilizes natural language processing to synthesize peer-reviewed abstracts into accessible topic summaries. This guide provides a framework for instructors to intentionally design research assignments that leverage Scopus AI for *discovery* while requiring students to maintain their critical role in *evaluation and synthesis*.

1. Designing AI-Integrated Assignments

- **Focus on the Discovery Phase:** Position Scopus AI as a tool to overcome "blank page syndrome." Encourage students to use it for initial brainstorming, defining complex terminology, and mapping broad topics into manageable research questions.
- **Require Natural Language Prompting:** Teach students to ask complete research questions (e.g., "What is the impact of trauma-informed pedagogy on secondary retention?") rather than using rigid Boolean strings. This helps surface related cross-disciplinary concepts.
- **Emphasize the "Human in the Loop":** Structure your rubric to reward critical evaluation of the AI output. Do not accept AI summaries as final sources; students must cite the original scholarly documents.

2. Guiding Student Navigation & Analysis

- **Topic Summaries & Verification:** Scopus AI generates high-level summaries referenced with specific citations. Instruct students to explicitly trace these claims by clicking the citation numbers and reading the original abstracts to verify accuracy.
- **Concept Mapping (Keyword Harvesting):** Use the clickable visual concept map to teach students how to harvest alternative keywords. They can then take these expanded vocabularies into deeper database searches.
- **Identifying Foundational Literature:** Direct students to the "Foundational Documents" and "Topic Experts" sections. This is an excellent pedagogical tool for teaching students how to identify seminal voices and trace the historiography of a concept.
