Teach for Integrity

Why students misuse AI — and what your course design can do about it

Megan Alstot, Ph.D. • Academy for Teaching & Learning

Faculty Workshop • Thursday, July 23, 2026 • Zoom

HITL²

Where are you with AI — in your course?

ZOOM POLL

However you answered: you belong in this hour.

The frame for this hour: HITL² — Humans in the Learning Loop

You're a human in a learning loop, teaching humans in your learning loops — and every one of us is figuring out how to learn in an AI-integrated loop. Together.

So: fluency doesn't presume enthusiasm. A No-AI course can be a deliberate, defensible design choice. This hour is design work we do side by side — not compliance work.

A note before we go further.

“You didn't ask for AI to arrive at our educational doorstep. . .

You didn't ask for an unregulated, untested, unreliable, untraceable, and unrelenting technology to upend education... it is clear the genie is out of the bottle... it is not going back in nor is it going to slow down for us to catch up” (Ludwig & Zakrajsek, 2026, p. 3).

Neither did your students.

You already have what you need

You don't have to be the AI expert. As scholars, you are already information fluent.

You think critically

You interrogate ideas for a living — AI output is just one more claim that hasn't earned your trust yet.

You ask good questions

Precise questions are your craft. That's all effective prompting has ever been.

You evaluate with a skeptical lens

Sources, methods, evidence — you already vet them daily. AI output gets the same treatment.

You push back

On assumptions, bias, leaps in logic, and unsupported claims — exactly where AI is weakest.

The work is not becoming an AI expert. It's teaching students to think like scholars.

The 4Ds: your scholar skills, with names students can carry

DELEGATION

Setting goals and deciding whether, when, and how to engage AI.

Your skill: judging what's worth your own cognition.

DESCRIPTION

Describing your goals clearly enough to prompt useful AI behavior.

Your skill: asking precise, well-scoped questions.

AI FLUENCY

effective · efficient
ethical · safe

DISCERNMENT

Accurately assessing the usefulness of AI outputs and behaviors.

Your skill: skeptical review of claims and evidence.

DILIGENCE

Taking responsibility for what we do with AI — and how we do it.

Your skill: scholarly accountability and disclosure.

You'll practice the Ds twice today — in the Guardrail Starters and in the stress test. · Dakan, Feller, & Anthropic (2025), CC BY-NC-SA 4.0

Cheating has always existed. AI didn't change why — it changed how.

Policing asks:

“How do I catch them after?”

- Surveillance, suspicion, detection tools
- Exhausting — and error-prone with AI
- Erodes the very relationship that prevents cheating

Mentoring asks:

“What invites the shortcut — and how do I design it out?”

- Conversation early and often
- Clarity about the line, and the why behind it
- Design that makes thinking visible

“Good teaching is still the best integrity builder.”

Bertram Gallant & Rettinger (2025)

Eleven reasons — and none of them are new

IN THE CHAT

From The Opposite of Cheating, ch. 1 — grouped by the instructional response they share.

Communication

Self-efficacy

Expectations

Consistent Values

Values

Motivation

Flexibility & Accountability

Procrastination

Cost-benefit

Design & Culture

Moral disengagement

Contract cheating

Peer effects

Narcissism

Instructor effects

Chat waterfall: which one lives in your courses? Type it — post together on my go.

Each reason is a question to ask of your assignment

TRY IT • LINK IN CHAT

COMMUNICATION

Self-efficacy — *Do they think they can?*

Expectations — *Do they know what counts as cheating here?*

CONSISTENT VALUES

Values — *Does this connect to what they're here to develop?*

Motivation — *What's the point — growth or the grade?*

FLEXIBILITY & ACCOUNTABILITY

Procrastination — *Where did the time go?*

Cost-benefit — *Is the shortcut rational here?*

DESIGN & CULTURE

Moral disengagement — *How do they justify it?*

Contract cheating — *Who actually did the work?*

Peer effects — *What does class culture say?*

Narcissism — *What rule applies to me?*

Instructor effects — *Does this teacher seem to care?*

2-4

Most good assignments invite two to four of the eleven — without anyone intending it.

Noticing is the mentoring move. This is design, not blame.

And here's the practical part:

almost every one of these is visible before the first submission — in who your students are, what your assignment says (and doesn't say), and how your deadlines are built. So the rest of this hour is six small teaching moves for seeing them early and designing them out.

PART 2 OF 2

Six small teaching moves

Jumping-off points, not a finished system. Every move has a ready-to-use tool waiting in your gift page.

1 Take the pulse

2 Name the kernel

3 Place yourself on the continuum

4 Stress test the assignment

5 Develop & place your policy

6 Let AI help you design

Take the pulse: a learner information survey

Week one, a graded survey for easy first points, ten minutes. These are professionals in careers — ask them like adults. You learn:

- Who they are: names and pronunciation, interests, what success means to them
- What they're carrying: work, caregiving, the responsibilities that collide with deadlines
- How they already use AI — explanations, feedback, studying, brainstorming — from their own report
- What worries them — asked confidentially, answered honestly

Say why you're asking: "In order to better support you..."

FROM THE SURVEY

"What name would you like me to use — and any pronunciation tips?"

"What is your definition of learning success? I will feel successful at the end of this course if ____."

"What responsibilities are you managing while being in college — work, caregiving, other obligations?"

"In what ways, if any, have you used AI tools to support your academic work?" (explanations · feedback · studying · brainstorming · editing · I don't use AI)

"In a word or two, how are you feeling about being in this class?"

"Is there anything you're concerned may interfere with your success? Confidential — between you and me."

Name the kernel of cognition

The thinking, growing, and learning an assignment exists to build — the part only the student can do.

AI that can enhance the kernel

- Explains a concept so the student can think with it
- Critiques the student's draft — flags, not fixes
- Organizes the student's own notes
- Quizzes, drills, and rehearses

AI that surrenders the kernel

- Generates the analysis
- Drafts the section or the post
- Interprets the data
- Draws the conclusions

The move: write one sentence at the top of the assignment — for you AND for them: “*The thinking this assignment builds is ___.*”
Every AI decision downstream gets easier.

Place yourself on the AI literacy continuum

Every level is a real choice — including Level 1. “Teach AI literacy” doesn't mean “use AI everywhere”: a No-AI assignment with a visible why is AI literacy. Wherever you land, you're in the loop with the rest of us.

Quiet time • 3 minutes • link in chat

Open the continuum self-evaluation. With your kernel in mind, mark two spots: where your course sits now, and where one assignment could sit next term. The gap between them is your growth edge. No sharing required — this thinking is yours.

Stress test the assignment — before your students do

Paste your assignment into the Assignment Integrity Stress Test: seven students, each having a specific bad day, each built from the eleven reasons.

The Doubter

The Line-Guesser

The Efficiency Rationalizer

The 11 PM Procrastinator

The Ghost-Writer Shopper

The Norm Reader

The Grade Maximizer

Each persona probes three failure layers:

1 • Temptation & ambiguity

“Reading this, I’d consider misusing AI because...”

2 • Kernel surrender

“While working, AI would end up doing the thinking because...”

3 • Evidence & accountability

“I could submit AI’s work with no trace because...”

You get a misuse-pressure report and a rebuilt assignment — guardrails matched to YOUR continuum level, every rail with its why. Run it in Baylor’s protected Copilot, in the tool your survey says students use.

In the chat: which persona breaks your current assignment first? • “2–4 flags is design, not failure.”

Develop your policy — then place it, then discuss it

Write it

- Start from the Guardrail Starters — rails keyed to your continuum level, for each of the 4Ds
- Every rail ships with its why. Rails without reasons read as arbitrary — and arbitrary rules feed rationalization

Place it

- Syllabus and LMS module — and every assignment brief
- The Line-Guesser reads the brief, not the syllabus. Silence in the brief reads as permission

Discuss it

- Early, as conversation — not warning. Sync: first-week talk. Async: short video + discussion thread
- Standing line: “when unsure, ask — asking is never a violation”

Mentoring beats policing here too: a policy students helped talk through is a norm, not a rule.

Teach students to set the rails: RADAR

R

Your role*"I'm a graduate student working on [assignment]..."*

A

AI's role*"Act as a peer reviewer / study coach / research librarian."*

D

Describe the task*What you're working on — and the sources or notes to use.*

A

Action to delegate*"Flag gaps / generate questions / check my logic — [the specific ask]."*

R

Rails — the guardrail*"Don't write it for me. Flag, don't fix — I'll decide. Ask before you suggest."*

THE MASTER GUARDRAIL — STUDENTS PASTE THIS FIRST

"Act as a learning coach. Do not write, solve, summarize, or revise my work for me. Do not generate final answers. Instead, help me think by asking questions, identifying issues, giving feedback, and suggesting next steps."

The full rail library — keyed to your continuum level, for all four Ds — is in the Guardrail Starters.

MOVE 6

Now open the throttle: let AI help you design

Five moves of guardrails have earned this one. Design work is where AI is strongest — and your kernel isn't at stake.

Scaffold it

"Break this assignment into 3 low-stakes checkpoints that make student thinking visible along the way."

Generate scenarios

"Create 5 discipline-specific ethical dilemmas about AI use in [field] for a case discussion."

Mine your objectives

"Here are my learning objectives. Where are ethical issues nested in them — and what real-world outcomes do they map to?"

Rethink the design

"Give me 10 alternatives to the essay for assessing [objective], and how each supports the learning."

Diligence, modeled: do this in Baylor's protected Copilot (green shield) — the same habit we're asking of students.

Your gift — let's open it together

2 MINUTES • LINK IN CHAT

1 The Eleven Reasons matrix

Every reason: its question, what feeds it, and its integrity builders.

2 Learner survey question bank

Copy into a Google Form tonight — Move 1, done by Friday.

3 Continuum + Guardrail Starters

Pick your level, get your rails — each one with the why students deserve.

4 Assignment Integrity Stress Test

Paste an assignment, meet your seven bad days — Copilot prompt or Claude Skill.

[malstot.github.io/
gifts/moody-2026](https://malstot.github.io/gifts/moody-2026)

Right now: open it and click the tool that matches your move. Two quiet minutes. The page isn't going anywhere — it's yours to keep, share with your team, and come back to all term.

Keep the human in the learning loop.

Your gift — everything from today, ready to use

- The slides + speaker notes
- Assignment Integrity Stress Test — Copilot prompt, Claude Skill, and a build-your-own-personas template
- Guardrail Starters — continuum × 4Ds interactive
- Learner survey question bank + the full Eleven Reasons matrix

malstot.github.io/gifts/moody-2026

That's what I'm here for. One-on-one consultations · small-group sessions · workshops built for your unit or team.
megan_alstot@baylor.edu

Before you go — in the chat: the ONE move you'll try this term.
